AcuteB Head

Photo: Gert Jansson

New AcuteB Head – the perfect match!

The new smaller AcuteB Head is a perfect match for the AcuteB 600, weighing a mere 1.45 kg, and using a new energy-saving 65W modelling lamp, with the effective brightness of nearly 100W.

Quality of Light

The Profoto system consists of different generators built and designed to meet the demands of the most demanding photographers. Yet the most important thing is the light you create and it is then essential that the system offers freedom to create your own light. The light source, both the flash tube and the modelling light, is placed high and free in the flash head. This makes it easier for you to adjust the light and use your creativity. Most reflectors can be moved forward or backward in relation to the optical centre of the light source, effectively narrowing or widening the spread of the light and changing the intensity and fall-off characteristics as well. Every single reflector and accessory creates its special light and the unique Profoto focusing system offers you a possibility to create your own light with only a few different reflectors.
